

**AMENDMENTS TO THE SPECIFICATION:**

*Please replace paragraph [19] with the following amended paragraph:*

[19] The method of the related art has many problems. For ~~Example~~ example, in the case of the packet method suggested by 3GPP, a plurality of AP's are transmitted for the respective packets, and the first AP is transmitted with the lowest level of transmission power set by the system for minimizing interruption to the other channels. Thus, accessing the base station takes a ~~long~~ long time using this method, since the AP is transmitted with initial transmission power which has fixed level, and the accessing process is performed each time a packet is transmitted. The disadvantageous delays associated with initial transmission power adjusting times,  $t$ , are illustrated in Figure 6. Accordingly, high speed data transmission is difficult.
